

Global Health Outcomes and Healthcare Expenditure Analysis (1960–2025)

WDI

A medical illustration featuring a central cross-section of a human brain, glowing with a blue and purple light. Surrounding the brain are four smaller, glowing green and yellow structures, possibly representing different brain regions or organs. To the right of the brain is a detailed illustration of a human heart, also glowing with a blue light. The background is dark blue with some faint, glowing dots.

Capstone Project AnalystLab Africa

Project Objective

This project analyzes global health outcomes across 264 countries from 1960–2025 using the World Development Indicators dataset. The analysis explores trends in life expectancy, healthcare expenditure, and road traffic mortality to provide data-driven insights for policymakers and stakeholders.

INSIGHTS

1. Global life expectancy has steadily increased over time, reflecting improvements in health outcomes across countries.
2. Female life expectancy (67.49 years) exceeds the global average life expectancy (64.91 years), indicating longer average lifespans among women globally.
3. Healthcare expenditure has shown an upward trend over the years, suggesting increased investments in healthcare systems worldwide.
4. Average road traffic mortality has generally declined over time, highlighting progress in road safety and public health interventions in many countries.

RECOMMENDATIONS

1. Governments should continue investing in healthcare infrastructure and preventive healthcare programs to sustain improvements in life expectancy.
2. Policymakers should strengthen road safety policies and emergency healthcare services to further reduce road traffic mortality rates.
3. Countries should leverage health data analytics to monitor trends and make evidence-based decisions on healthcare resource allocation.
4. International collaboration should be encouraged to reduce global health disparities by supporting countries with poorer health outcomes.
