

Global Health Outcomes and Healthcare Expenditure Analysis (1960-2025)

A World Development Indicators (WDI) Dashboard Analysis
Prepared by: Esther Ayodele

Project Objective

This project analyzes global health outcomes across 264 countries using the World Development Indicators dataset. The analysis focuses on life expectancy, healthcare expenditure, and road traffic mortality to identify meaningful trends and support evidence-based decision-making.

Problem Statement

Global health outcomes vary across countries due to differences in healthcare investments and public health conditions. Understanding long-term trends in key health indicators can support informed policy decisions and highlight areas requiring intervention.

Dataset Description

Source: World Bank World Development Indicators (WDI). Coverage: 264 countries and territories from 1960 to 2025. Selected indicators include Total Life Expectancy, Female Life Expectancy, Health Expenditure (% of GDP), and Mortality caused by Road Traffic Injury.

Data Cleaning Process

- 1 Unpivoted yearly columns into Year and Indicator Value fields.
- 2 Filtered selected health indicators for analysis.
- 3 Pivoted indicators into separate analytical columns.
- 4 Validated data types and retained available observations for analysis.

Analysis Methodology

Power Query was used for transformation, DAX measures were created for key metrics, and Power BI visuals were developed to analyze trends and comparisons across countries and years.

Key Findings

- Global life expectancy has generally improved over time.
- Female life expectancy exceeds the global average life expectancy.
- Healthcare expenditure has increased over the years.
- Average road traffic mortality has generally declined over time.

Insights

- Improvements in health outcomes have been observed across many countries.
- Healthcare investments have increased alongside improvements in health indicators.
- Significant disparities remain across countries in health outcomes.
- Road traffic mortality remains an important public health concern.

Recommendations

- Continue investing in healthcare infrastructure and preventive healthcare programmes.
- Strengthen road safety policies and emergency response systems.
- Promote data-driven healthcare planning and monitoring.
- Encourage international collaboration to address global health disparities.

Conclusion

The analysis highlights positive global trends in health outcomes while emphasizing the need for sustained healthcare investments and targeted interventions. Continuous monitoring of health indicators remains essential for informed policymaking.

Limitations

Some indicators contain limited historical observations across countries and years. The analysis is descriptive and does not establish causal relationships between healthcare expenditure and health outcomes.
